Enter your data. A line graph requires two axes in order to function. Enter your data into two columns. For ease of use, set your X-axis data (time) in the left column and your recorded observations in the right column.

Line graphs can be used to show how information or data change over time. They have an x-axis (horizontal) and y-axis (vertical). Usually the x-axis shows the time period and the y-axis shows what is being measured. Line graphs can be used when you are plotting data that have peaks (ups) and troughs ...

Line graphs are appropriate only when both the X- and Y-axes display ordered (rather than qualitative) variables. Although bar graphs can also be used in this situation, line graphs are

generally better at comparing changes over time.

Scatter Plots. A Scatter (XY) Plot has points that show the relationship between two sets of data.. In this example, each dot shows one person's weight versus their height. (The data is plotted on the graph as "Cartesian (x,y) Coordinates")Example: The local ice cream shop keeps track of how much ice cream they sell versus the noon temperature on that day.

Answer: The graph is represented by the inequality $y > 3x + 2$. Step-by-step explanation: Linear inequality is like linear equation just we have inequality signs ($<$, $>$, \leq , \geq) instead of equal sign ($=$).

Which linear inequality is represented by the graph? $y < 2x + 3$...

4. The Graph of a Function. The graph of a function is the set of all points whose co-ordinates (x, y) satisfy the function $y = f(x)$. This means that for each x -value there is a corresponding y -value which is obtained when we substitute into the expression for $f(x)$. Since there is no limit to the possible number of points for the graph of the function, we will follow this procedure at first:
