In this section we will discuss how to solve trig equations. The answers to the equations in this section will all be one of the "standard" angles that most students have memorized after a trig class. However, the process used here can be used for any answer regardless of it being one of the standard angles or not.

Calculus I - Solving Trig Equations

In this section we will discuss a couple of methods for solving equations that contain logarithms. Also, as we'll see, with one of the methods we will need to be careful of the results of the method as it is always possible that the method gives values that are, in fact, not solutions to the equation.

Algebra - Solving Logarithm Equations

In mathematics, to solve an equation is to find its solutions, which are the values (numbers, functions, sets, etc.) that fulfill the condition stated by the equation, consisting generally of two expressions related by an equality sign. When seeking a solution, one or more free variables are designated as unknowns. A solution is an assignment of expressions to the unknown variables that makes ...

The is also equal to Therefore, two of the solutions to the problem are and The period of the sin function is This means that the values will repeat every radians in both directions. Therefore, the exact solutions are and where n is an integer. The approximate solutions are and where n is an integer.

SOLVING TRIGONOMETRIC EQUATIONS

In mathematics, a system of linear equations (or linear system) is a collection of two or more linear equations involving the same set of variables. For example, $+ - = - + = - - + - =$ is a system of three equations in the three variables x, y, z. A solution to a linear system is an assignment of values to the variables such that all the equations are simultaneously satisfied.
