CHEMISTRY LAB: SPECIFIC HEAT OF A METAL - Kwanga.net

DETERMINATION OF SPECIFIC HEAT PRE-LAB DISCUSSION: The amount of heat required to raise the temperature of a solid body depends on its change in temperature (ΔT), its mass (m), and an intrinsic characteristic of the material forming the body called specific heat (c_p). The heat is calculated from the equation

In this virtual lab, you will use coffee cup calorimetry to determine the specific heat, c , of a metal.

Experiments have shown that the heat transfer $Q = mc\Delta T$, where $\Delta T = T_{\text{final}} - T_{\text{initial}}$ of the object you're considering, m is its mass, and c is referred to as the "specific heat" of the material it's made up of. For most materials over a wide range of temperatures, c is close enough to a constant value that we will consider it to be exactly constant.

Why do objects like wood float in water? Does it depend on size? Create a custom object to explore the effects of mass and volume on density. Can you discover the relationship? Use the scale to measure the mass of an object, then hold the object under water to measure its volume. Can you identify all the mystery objects?

Three large bearing sets being removed from Metlab180" diameter by 156" high carburizing furnace from the hardening temperature (1550°F) for subsequent quenching into agitated, hot oil. Parts were carburized to a case depth in excess of 0.200" ECD. Fixture and component weight is about 40,000 pounds.

The Virtual Lab is an online simulation of a chemistry lab. It is designed to help students link chemical computations with authentic laboratory chemistry. The lab allows students to select from hundreds of standard reagents (aqueous) and manipulate them in a manner resembling a real lab. More information and offline downloads.
