

## *The Sun S Path Observation Lab Answers*

### **The Sun S Path Observation**

The Sun is the star at the center of the Solar System. It is a nearly perfect sphere of hot plasma, with internal convective motion that generates a magnetic field via a dynamo process. It is by far the most important source of energy for life on Earth. Its diameter is about 1.39 million kilometers (864,000 miles), or 109 times that of Earth, and its mass is about 330,000 times that of Earth.

### **Sun - Wikipedia**

Saturn is the sixth planet from the Sun and the second-largest in the Solar System, after Jupiter. It is a gas giant with an average radius about nine times that of Earth. It has only one-eighth the average density of Earth, but with its larger volume Saturn is over 95 times more massive. Saturn is named after the Roman god of agriculture; its astronomical symbol ( $\text{♄}$ ) represents the god's sickle.

Sun chart Sun path charts can be plotted either in Cartesian (rectangular) or Polar coordinates. Cartesian coordinates where the solar elevation is plotted on X axis and the azimuth is plotted on the Y axis. Polar coordinates are based on a circle where the solar elevation is read on the various concentric circles, from 0° to 90° degrees, the azimuth is the angle going around the circle from ...

Sun: Sun, star around which Earth and the other components of the solar system revolve. It is the dominant body of the system, constituting more than 99 percent of its entire mass. The Sun is the source of an enormous amount of energy, a portion of which provides Earth with the light and heat necessary to support life.

In Galileo's time-- science began using man's most reliable truth detector---- "Repeatable published physical measurements of the thing under study coupled with vigorous technical debate using a common language called mathematics". It works! A popular example of it working is forensic medicine in law enforcement. Compare today with technology with 50 years ago.

Note that  $Dt$  here is a distance, which is converted to time via  $c$ . Equations 3 and 5 predict that a radio signal emitted from the Earth, grazing the Sun and immediately retransmitted toward us when reaching planet Mars will, according to general relativity, travel during a time which is 250 ms longer than the time calculated using the velocity of light  $c$  (in zero gravitational potential).
